Graphing Module as an add-on to the Consulting Nutritionist

In the most current versions of Dalex the graphing tab shows up as a third tab in the ration balancing work screen. With this window, you can graphically represent the Contribution of each ingredient to the Total ration nutrient requirements.

In the following example, the graph is set to another one of the preconfigured lists to display required nutrients. This functionality allows a producer or the nutritionist to see what is going on in the ration on a graphical basis.
This tool has been used by many as a way of representing to clients what their current feeding plan is lacking. This is a great tool and an excellent way of differentiating a nutritionist from others who are trying to curry favor with the producer. In the following example, the dical and mineral mixes were removed from the ration. You can now see the effect on the phosphorous, selenium and vitamin A levels.
